AUTOMORPHISMS OF COMPLEX TORI OF THE FORM $E \times E$

SIMON KAPFER

Let $\Lambda_0 \subset \mathbb{C}$ be a lattice of rank 2. We may assume that $\Lambda_0 = \mathbb{Z} + \mathbb{Z}\tau$ for a complex number $\tau \in \mathbb{C}\backslash\mathbb{R}$. We set $\Lambda := \Lambda_0 \times \Lambda_0$, $E := \mathbb{C}/\Lambda_0$ and $A := E \times E$. By an automorphism of A we mean a biholomorphism preserving the group structure. This is the same as a \mathbb{C} -linear map $M : \mathbb{C}^2 \to \mathbb{C}^2$ with $M\Lambda = \Lambda$.

In the appendix of [1] we find a study of automorphisms of 2-dimensional complex tori. In our case, $A = E \times E$, the automorphism group is given by $GL(2, End(\Lambda_0))$. Here, $End(\Lambda_0)$ is the set $\{z \in \mathbb{C} \mid z\Lambda_0 \subset \Lambda_0\}$. Given such a z, then we have

$$z \cdot 1 = a + b\tau$$
 and $z \cdot \tau = c + d\tau$ with $a, b, c, d \in \mathbb{Z}$.

We get the condition

$$(a+b\tau)\tau = c+d\tau \quad \Leftrightarrow \quad b\tau^2 + (a-d)\tau - c = 0.$$

Up to scalar multiples, there is a unique real quadratic polynomial that annihilates τ , namely $(x-\tau)(x-\bar{\tau})=x^2-2\Re(\tau)x+\|\tau\|^2$. So we have 2 possibilities:

- (1) Both the real part and the square norm of τ are rational numbers, say $2\Re(\tau)=\frac{p}{r}$ and $\|\tau\|^2=\frac{q}{r}$ with r>0 as small as possible. Then $z=a+b\tau$ with arbitrary $a\in\mathbb{Z}$ and $b\in r\mathbb{Z}$, so $\operatorname{End}(\Lambda_0)=\mathbb{Z}+r\tau\mathbb{Z}$.
- (2) At least one of $\Re(\tau)$, $\|\tau\|^2$ is irrational. Then z=a and $\operatorname{End}(\Lambda_0)=\mathbb{Z}$.

If I understand properly, in [2, proof of Prop. 5.2] it is claimed that the automorphism group of A, when restricted to the three-torsion points A[3], contains the symplectic group $\operatorname{Sp}(A[3]) = \operatorname{Sp}(4,\mathbb{F}_3)$. At least in the second case this is impossible, because then $\operatorname{Aut}(A) = \operatorname{GL}(2,\mathbb{Z})$, so $\operatorname{Aut}(A) \otimes \mathbb{F}_3 = \operatorname{GL}(2,\mathbb{F}_3)$ is a group of order 48 (cf. [3]). On the other hand, the order of $\operatorname{Sp}(4,\mathbb{F}_3)$ is 51840 (cf. [4]).
